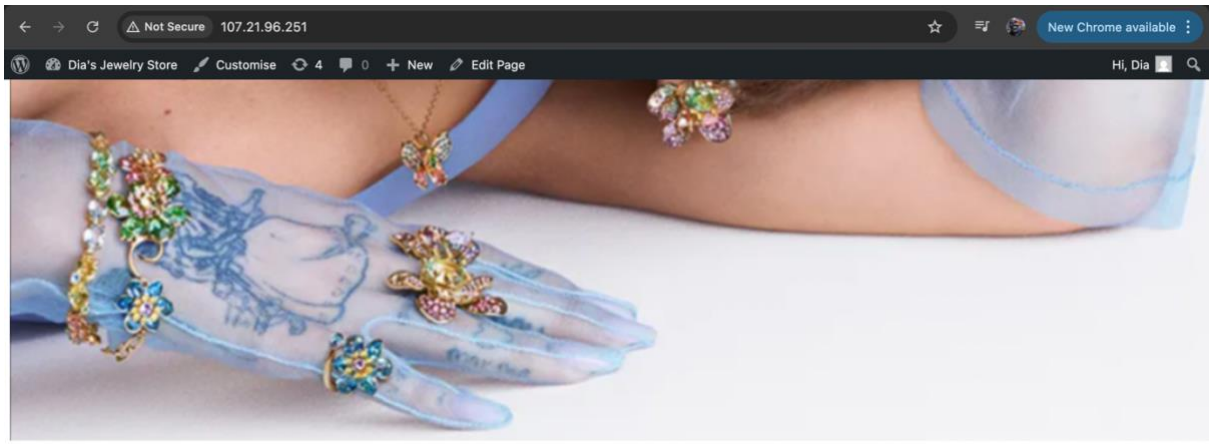
Screenshot 4: Image in the end of the page



Although the current version of the store does not support transactions or inventory management yet, it lays the groundwork for future development. Additional features such as payment gateways, user login, and product databases are upcoming. For now, the focus is gathering ✨a vibe✨

Process Documentation

To enhance the visuals of my page, I removed all the old writings and added a different layout. I added 4 images to my online store, which is called “Dia’s Jewelry Store” or “DJS” for short. I logged into my WordPress dashboard and uploaded some photos using the Media option. Then I accessed the page editor and edited my front page. Using the block editor, I inserted an image at the top of the page as background and added my store name over it. Then I inserted a few images asymmetrically and played with their sizes. I added some text here and there to make it look its purpose. I also added image credits at the bottom as each image was selected based on pop culture themes and jewellery relevance. Due to JSON errors during editing, I temporarily set permalinks to ‘Plain’ in WordPress Settings > Permalinks. This allowed successful page updates for presentation purposes. The new design better reflects the style and brand of the store while making the site more engaging.

This was my original page that I made for the TCO Presentation, for this new project I erased the old one’s infrastructure and made it into something completely different. At first, I used Elementor

but later I deactivated that plugin and did the design from the code edit option in WordPress for a more authentic approach. The technique I used for making this store site was the easiest one in my opinion.
